

HTML Checker dengan Pushdown Automata

LAPORAN TUGAS BESAR

Diajukan sebagai salah satu tugas mata kuliah Teori Bahasa Formal dan
Otomata IF2124 Tahun 2023/2024

Disusun oleh:

Denise Felicia Tiowanni (13522013)

Kayla Namira Mariadi (13522050)

Erdianti Wiga Putri Andini (13522053)

BAB I

DESKRIPSI MASALAH

1.1. Deskripsi Umum HTML

Dalam pengembangan suatu *website*, HTML (Hypertext Markup Language) adalah bahasa yang digunakan untuk membangun struktur dasar suatu halaman *website*. Pada proses pembuatan halaman *website*, penting untuk memastikan bahwa kode HTML yang dibuat sesuai dengan aturan sintaks yang berlaku. Untuk memastikan kevalidan dan konsistensi struktur HTML, diperlukan suatu mekanisme pemeriksaan sintaks, dan salah satu pendekatan yang dapat digunakan adalah dengan menggunakan Pushdown Automata (PDA).

Pushdown Automata merupakan sebuah model komputasi teoritis yang dapat digunakan untuk mengenali bahasa kontekstual, termasuk bahasa yang dapat dihasilkan oleh grammar kontekstual seperti grammar yang mendefinisikan sintaks HTML.

Pada Tugas Besar ini, dibuat suatu sistem otomatis untuk memeriksa validitas sintaks HTML melalui pendekatan yang berfokus pada salah satu materi yang diajarkan pada Mata Kuliah Teori Bahasa Formal dan Otomata, yaitu Pushdown Automata. Dengan melibatkan konsep Pushdown Automata, sistem ini bertujuan untuk memastikan bahwa setiap dokumen HTML yang diuji sesuai dengan aturan sintaks yang ditetapkan, sehingga pengembangan sebuah *website* dapat lebih efisien dan terstruktur.

1.2. Tags HTML

Tags HTML yang kami validasi pada tugas besar ini tidak mencakup seluruh tags, hanya tag-tag pada tabel berikut.

Tag	Atribut Tambahan	Void Element	Catatan Tambahan
html	-		Tag html wajib ada Dokumen harus diawali tag html

head	-		Tag head wajib ada, Tag head harus berada di dalam tag html dan diatas tag body
body			Tag body wajib ada, Tag body harus berada di dalam tag html dan dibawah tag head. Semua elemen yang disebutkan setelah ini kecuali title harus berada di dalam body, namun tidak semua tag wajib ada di dalam body.
title			Hanya boleh berada dalam head
link	rel, href	v	Atribut rel wajib ada, dapat berada dalam head
script	src		dapat berada dalam head
h1, h2, h3, h4, h5, h6			
p			
br		V	
em			
b			
abbr			
strong			
small			
hr		V	
div			

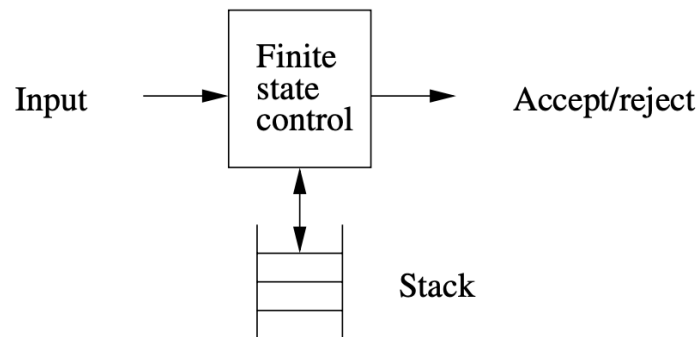

a	href		
img	src, alt	V	Atribut src wajib ada
button	type		Nilai attribute type dibatasi pada submit, reset, button
form	action, method		Nilai method harus dibatasi pada GET atau POST
input	type	V	Nilai attribute type harus dibatasi pada text, password, email, number, atau checkbox
table			Bentuk tabel tidak perlu diperhatikan (tidak apa-apa jika baris 1 terdiri dari 1 kolom sedangkan baris 2 terdiri dari 2 kolom)
tr			Tag tr harus berada dalam tag table
td			Tag td harus berada dalam tag table
th			Tag th harus berada dalam tag table

BAB II

LANDASAN TEORI

2.1 Pushdown Automata

Pushdown Automata (PDA) adalah jenis finite automata non-deterministik dengan kemampuan tambahan yaitu stack yang digunakan untuk menyimpan informasi dalam jumlah tak terbatas. Berbeda dengan komputer umum, PDA hanya dapat mengakses informasi pada tumpukannya dengan cara kerja Last In, First Out.

Gambar 1. Stack pada Pushdown Automata

Notasi untuk Pushdown Automata mencakup tujuh komponen, diantaranya termasuk diagram transisi yang merepresentasikan keadaan, transisi, dan operasi tumpukan. Notasi suatu PDA dapat dituliskan sebagai berikut:

$$P = (Q, \Sigma, \Gamma, \delta, q_0, Z_0, F)$$

dengan keterangan yaitu,

Q = kumpulan states pada PDA

Σ = simbol input

Γ = simbol stack

δ = fungsi transisi

q_0 = state awal

Z_0 = stack awal

F = kumpulan final states

Penerimaan suatu bahasa pada Pushdown Automata dapat tercapai dengan dua cara, yaitu:

a. Penerimaan dengan Tumpukan Kosong (*Empty Stack*)

Seperti yang disebutkan sebelumnya, PDA memiliki satu komponen penting yang disebut dengan tumpukan (*stack*). Tumpukan ini digunakan untuk menyimpan informasi sementara selama pemrosesan string input. Sebuah PDA dikatakan menerima string input jika, setelah semua simbol dari string tersebut telah dibaca dan diproses, tumpukan menjadi kosong. *Empty stack* menunjukkan bahwa PDA telah berhasil memproses seluruh string input dan tidak ada simbol yang tersisa di tumpukan. Jika tumpukan kosong pada akhir pemrosesan, PDA dianggap menerima string tersebut.

b. Penerimaan dengan *Final State*

Sama seperti automata lainnya, PDA juga memiliki *state*. Dalam konteks *final state*, sebuah PDA dapat dikonfigurasi untuk memasuki suatu *final state* setelah membaca seluruh string input. Sebuah PDA dikatakan menerima string input jika, setelah membaca seluruh simbol dari string tersebut, PDA berada *final state*. *Final state* menandakan bahwa PDA telah mengenali string input sesuai dengan aturan dan transisi yang didefinisikan, dan berada dalam keadaan di mana pemrosesan input dianggap selesai.

2.2 Bahasa Pemrograman HTML (Hypertext Markup Language)

Hypertext Markup Language, atau biasa disebut HTML, adalah bahasa yang digunakan untuk membuat sekaligus mendesain suatu halaman *website* dengan menggunakan serangkaian elemen atau tag. HTML dijaga oleh World Wide Web

Consortium (W3C) dan spesifikasinya secara teratur diperbarui untuk memastikan konsistensi dan kompatibilitas di berbagai browser web.

HTML menyediakan berbagai cara untuk mengorganisir konten pada halaman *website*. Hal ini mencakup elemen untuk judul, paragraf, daftar, tautan, gambar, formulir, dan masih banyak lagi. Masing-masing dari serangkaian elemen ini didefinisikan oleh tag HTML. Tag berada di dalam tanda kurung sudut, dan kebanyakan hadir dalam pasangan. Pasangan disini berarti ia memiliki tag pembuka (< >) dan tag penutup (</ >), dimana konten ditempatkan diantara tag pembuka dan penutup.

Tag HTML dapat mencakup atribut yang memberikan informasi tambahan tentang elemen. Atribut ditambahkan ke tag pembuka dan biasanya berupa pasangan nama-nilai. Contoh:

```
<a  
href="https://docs.google.com/document/d/1W5QSSHVrXvArj3Aonw4FhbfctBK6J2YGefXpWsLW43Y/"> Semangat TUBES  
TBFO! </a>
```

dalam contoh ini, 'href' merupakan atribut yang menentukan referensi *hyperlink*.

Dokumen HTML biasanya memiliki struktur yang mencakup kepala (*head*) dan tubuh (*body*). Kepala berisi informasi mengenai dokumen, seperti judul, sedangkan tubuh berisi konten HTML yang sebenarnya. HTML sering digunakan bersama dengan Cascading Style Sheets (CSS) untuk gaya dan JavaScript untuk interaktivitas guna membuat situs *website* yang dinamis dan menarik secara visual.

BAB III

ANALISIS PEMECAHAN MASALAH

3.1 State Pushdown Automata

Berikut adalah hasil Pushdown Automata yang telah kelompok kami buat untuk melakukan validasi terhadap sintaks *file* HTML.

3.2. Program HTML Checker

Berikut adalah fungsi-fungsi yang telah kelompok kami buat untuk melakukan validasi terhadap sintaks *file* HTML menggunakan PDA pada 3.1.

NO	Fungsi	Tujuan
1.	get_HTML_path (html_file_name)	Fungsi untuk mendapatkan path dari suatu file HTML agar dapat dibaca pada fungsi tokenizer.
2.	read_txt_to_matrix (file_path)	Fungsi untuk membaca file pda.txt dan mengubahnya menjadi bentuk matriks dengan rincian: <ul style="list-style-type: none">- Row [0] = current state- Row [1] = input- Row [2] = current top of stack- Row [3] = next state- Row [4] = stack
3.	tokenize_html_with_regex (html_content)	Fungsi dan prosedur untuk membaca file kemudian akan dibaca kata per kata yang ada di dalam file tersebut dan mengubahnya sebagai token. Penggunaan regex disini berfungsi untuk memudahkan kami dalam parsing html file agar kami tidak perlu mengecek simbol < >. Kami menganggap bila ditemukan simbol < maka otomatis menjadi opening tag dan ditutup oleh >.
4.	add_method_values (html_arr, method_values)	Prosedur untuk menyimpan value atribut form method=. Hal ini dilakukan karena adanya pembatasan value atribut form method=.

5.	add_input_types (html_arr, input_types)	Prosedur untuk menyimpan value atribut input type=. Hal ini dilakukan karena adanya pembatasan value atribut input type=.
6.	add_button_types (html_arr, button_types)	Fungsi untuk menyimpan value atribut button type=. Hal ini dilakukan karena adanya pembatasan value atribut button type=.

BAB IV

IMPLEMENTASI DAN UJI COBA

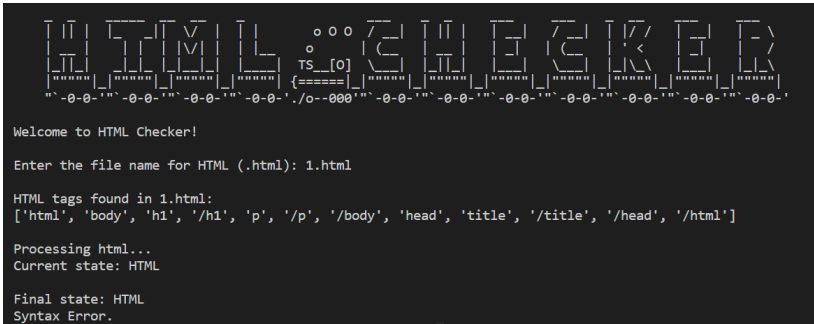

4.1 inputAcc.html

Code	<pre> test >  inputAcc.html >  html 1 <html> 2 3 <head> 4 <title>Simple Webpage</title> 5 </head> 6 <body> 7 <h1>Hello, World!</h1> 8 <p>This is a simple webpage.</p> 9 </body> 10 </html> </pre>
Output Checker	 <pre> Welcome to HTML Checker! Enter the file name for HTML (.html): inputAcc.html HTML tags found in inputAcc.html: ['html', 'head', 'title', '/title', '/head', 'body', 'h1', '/h1', 'p', '/p', '/body', '/html'] Processing html... Current state: HTML Processing head... Current state: HEAD Processing title... Current state: TITLE Processing /title... Current state: HEAD Processing /head... Current state: XHEAD Processing body... Current state: BODY Processing h1... Current state: H1 Processing /h1... Current state: BODY Processing p... Current state: P Processing /p... Current state: BODY Processing /body... Current state: XBODY Processing /html... Current state: FINAL Final state: FINAL Accepted. </pre>
Penjelasan	<p>File tersebut berstatus accepted karena semua tagnya sudah sesuai dengan PDA, baik itu opening tag, closing tag, dan atributnya.</p>

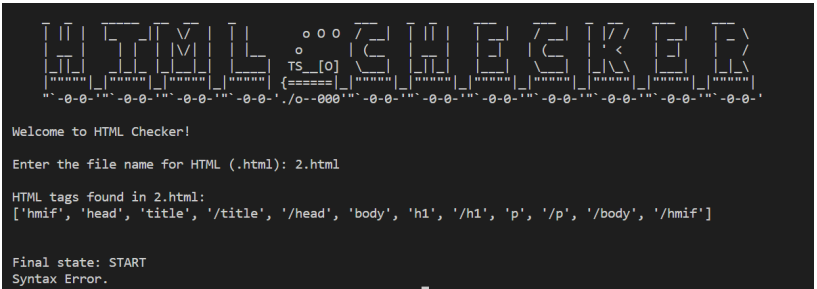

4.2 inputReject.html

Code	<pre>test > inputReject.html > html 1 <html> 2 3 <title>Simple Webpage</title> 4 </head> 5 <body> 6 <h1>Hello, World!<h1> 7 <p>This is a simple webpage.</p> 8 </body> 9 </html></pre>
Output Checker	<pre> Welcome to HTML Checker! Enter the file name for HTML (.html): inputReject.html HTML tags found in pda2.txt: ['html', 'head', 'title', '/title', '/head', 'body', 'h1', 'h1', 'p', '/p', '/body', '/html'] Processing html... Current state: HTML Processing head... Current state: HEAD Processing title... Current state: TITLE Processing /title... Current state: HEAD Processing /head... Current state: XHEAD Processing body... Current state: BODY Processing h1... Current state: H1 Final state: H1 Syntax Error.</pre>
Penjelasan	<p>File tersebut berstatus error karena tag h1 tidak ditutup dengan benar. Harusnya tag penutupnya adalah </h1> namun pada file tersebut adalah <h1> sehingga tidak sesuai dengan PDA dan berakhir error. State pada file tersebut berakhir pada state H1.</p>

4.3 1.html

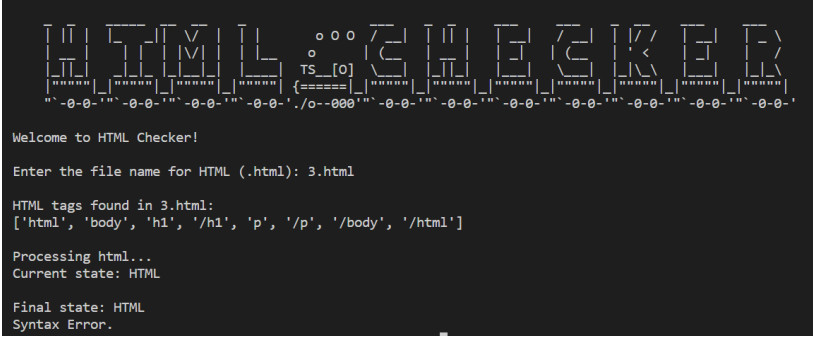

Code	<pre> 1 <html> 2 <body> 3 <h1>Hello, World!</h1> 4 <p>This is a simple webpage.</p> 5 </body> 6 <head> 7 <title>Simple Webpage</title> 8 </head> 9 </html> </pre>
Output Checker	 <pre> Welcome to HTML Checker! Enter the file name for HTML (.html): 1.html HTML tags found in 1.html: ['html', 'body', 'h1', '/h1', 'p', '/p', '/body', 'head', 'title', '/title', '/head', '/html'] Processing html... Current state: HTML Final state: HTML Syntax Error. </pre>
Penjelasan	<p>File tersebut berstatus error karena setelah tag html langsung tag body, tidak ada tag head serta tag head berada setelah tag body. Karena kondisi tersebut tidak sesuai dengan state PDA, maka pada state tersebut akan eror dan akhirnya state berakhir pada state HTML.</p>

4.4 2.html

Code	<pre> test > 2.html > hmif 1 <hmif> 2 <head> 3 <title>Simple Webpage</title> 4 </head> 5 <body> 6 <h1>Hello, World!</h1> 7 <p>This is a simple webpage.</p> 8 </body> 9 </hmif> </pre>
Output Checker	 <pre> Welcome to HTML Checker! Enter the file name for HTML (.html): 2.html HTML tags found in 2.html: ['hmif', 'head', 'title', '/title', '/head', 'body', 'h1', '/h1', 'p', '/p', '/body', '/hmif'] Final state: START Syntax Error. </pre>
Penjelasan	<p>File tersebut berstatus error karena tag pertama bukan tag html. Karena kondisi tersebut tidak sesuai dengan state PDA, maka pada state tersebut akan eror dan akhirnya state berakhir pada state START.</p>

4.5 3.html

Code	<pre> test > 3.html > html 1 <html> 2 <body> 3 <h1>Hello, World!</h1> 4 <p>This is a simple webpage.</p> 5 </body> 6 </html> </pre>
------	---

Output Checker	 <pre> Welcome to HTML Checker! Enter the file name for HTML (.html): 3.html HTML tags found in 3.html: ['html', 'body', 'h1', '/h1', 'p', '/p', '/body', '/html'] Processing html... Current state: HTML Final state: HTML Syntax Error. </pre>
Penjelasan	<p>File tersebut berstatus error karena tidak memiliki tag head. Karena kondisi tersebut tidak sesuai dengan state PDA, maka pada state tersebut akan eror dan akhirnya state berakhir pada state HTML.</p>

4.6 4.html

Code	 <pre> test > 4.html > html 1 <html> 2 <head> 3 <title>Simple Webpage</title> 4 </head> 5 <body> 6 <h1>Hello, World!</h1> 7 <h2>Welcome to my page</h2> 8 9 <p>This is a simple webpage.</p> 10 <div id="footer" class="footer"> This is the end of the page </div> 11 </body> 12 </html> 13 </pre>
Output Checker	 <pre> Welcome to HTML Checker! Enter the file name for HTML (.html): 4.html HTML tags found in 4.html: ['html', 'head', 'title', '/title', '/head', 'body', 'h1', '/h1', 'h2', '/h2', 'img', 'src=', '', '', 'p', 'em', '/em', '/p', 'div', 'id=', '', '', 'class=', '', '', '/div', '/body', '/html'] </pre>

BAB V

PENUTUP

5.1 Kesimpulan

Pushdown Automata digunakan sebagai model komputasi untuk memvalidasi sintaks HTML berdasarkan aturan dan *transition state* yang telah ditentukan. Pendekatan ini membantu dalam mendeteksi dan mengatasi kesalahan sintaks yang mungkin terjadi dalam dokumen HTML.

Hasil pengujian menunjukkan bahwa HTML *checker* dengan Pushdown Automata mampu secara efektif mengidentifikasi kesalahan sintaks dalam dokumen HTML. Penerapan PDA memungkinkan penanganan struktur HTML dengan baik, memastikan bahwa setiap elemen dan *tag* mengikuti aturan yang ditetapkan. Meskipun masih ada ruang untuk pengembangan lebih lanjut, seperti penanganan kasus-kasus khusus, hasil awal menunjukkan bahwa pendekatan ini dapat menjadi dasar yang baik untuk pengembangan HTML *checker* yang lebih canggih.

Kelebihan dari penggunaan Pushdown Automata dalam HTML *checker* adalah kemampuannya dalam menangani struktur HTML yang dapat memeriksa kesesuaian tanda tutup (< atau >), serta mendeteksi kemungkinan kesalahan sintaks dengan lebih baik. Namun, tantangan yang mungkin dihadapi melibatkan penanganan kasus-kasus khusus atau fitur HTML yang kompleks. Dengan demikian, HTML *checker* dengan Pushdown Automata dapat dianggap sebagai alat yang efektif untuk memastikan kebenaran suatu struktur HTML, meskipun perlu perhatian lebih lanjut untuk pengembangan dan peningkatan fungsionalitasnya.

5.2 Saran

Terdapat beberapa saran yang dapat kami ajukan pada tugas besar ini, diantaranya:

1. Manajemen waktu yang lebih baik, sehingga tugas besar dapat selesai lebih awal dan dapat mencoba lebih banyak *testcase* dan *error handling*.
2. Membuat *transition state* Pushdown Automata yang lebih lengkap dan baik.

5.3 Github Repository

Link Github *repository* Tugas Besar Mata Kuliah IF2124 Teori Bahasa Formal dan Otomata (kelompok denisepro) dapat diakses pada tautan berikut: https://github.com/wigaandini/IF2124_TBFO_HTMLCheckerPDA.

5.4 Diagram State

Link diagram *state* Pushdown Automata (PDA) Tugas Besar Mata Kuliah IF2124 Teori Bahasa Formal dan Otomata (kelompok denisepro) dapat diakses pada tautan berikut: https://drive.google.com/file/d/1i6M4W5LrdqCZXAFtshKjnvCpq_wXevyE/view?usp=s [haring](https://app.diagrams.net/). (catatan: buka pada situs <https://app.diagrams.net/>).

5.5 Pembagian Kerja

NIM	Nama	Tugas
13522013	Denise Felicia Tiowanni	<ul style="list-style-type: none">- Membuat <i>transition state</i> PDA- Membuat tokenizer- Membuat laporan bab 1, bab 2, bab 5
